### Help

Turning off these sources might impede profile updates, while removing them could compromise the stability of the Engage space, potentially making it irrecoverable. To ensure the system's integrity, Segment highly recommends leaving these sources enabled.

## Working with the Debugger

Navigate to the Debugger tab on the Unify settings page of the space you want to debug. Select the source you want to inspect in the Debugger.

The Debugger presents a stream of incoming events. The event inspector displays three tabs for each event:

- Pretty view** shows the actual API call Segment sends to your destination.
- Raw view** shows the full JSON object Segment sends to your destination from the calls you sent, including timestamps, properties, traits, and ids.
- Violations** displays any violations triggered by the event.

Similar to the Connections Debugger, you can search through events using information contained within the event's payload.
