Getting Started

When you enable Errorception in the Segment web app, your changes appear in the Segment CDN in about 45 minutes, and then Analytics.js starts asynchronously loading Errorception's `beacon.js` library on to your page. This means you should remove the original Errorception's snippet from your page.

🔔 Your Errorception dashboard starts showing any JavaScript errors that occur on your site.

Errorception is only supported on the client-side.

Identify

This is only active if you set the `meta` setting to be true. When you call `identify` we set Errorception's `_errs.meta` to be the `traits` you passed in.

Settings

Segment lets you change these destination settings from the Segment app without having to touch any code.

SETTING	DESCRIPTION
Include custom user data with Errorception's error tracking	<code>boolean</code> , defaults to <code>TRUE</code> . When this option is enabled we will store metadata about the user on <code>identify</code> calls, using the Errorception meta API .
Project ID <i>(required)</i>	<code>string</code> . You can find your Project ID under the Settings tab on the Project page of your Errorception account. Your Project ID is the long hexadecimal number inside <code>_errs['PROJECT_ID']</code> . You can also just copy it out of your Errorception URL, <code>/projects/PROJECT_ID</code> . It should be 24 characters long and look something like this: <code>326b76b52f52c3f662000140</code> .
