### Config API

### Help

Configure a Tracking Plan to see how data conforms to your expected schema

Query Event Delivery metrics to build custom dashboards and alerts to monitor delivery of your events to destinations

Filter entire events or individual fields from reaching specific destinations

The Config API is a set of REST services under [segmentapis.com](#):

SERVICE	DESCRIPTION
<a href="#">Access Tokens</a>	Manage access tokens
<a href="#">Source Catalog</a>	Get info about all event and cloud sources
<a href="#">Destination Catalog</a>	Get info about all destinations
<a href="#">Workspaces</a>	Get info about workspaces
<a href="#">Sources</a>	Manage workspace sources
<a href="#">Destinations</a>	Manage workspace destinations

SERVICE	DESCRIPTION
<a href="#">Tracking Plans</a>	Manage workspace tracking plans
<a href="#">Event Delivery Metrics</a>	Get event delivery metrics for cloud-mode destinations
<a href="#">Destination Filters</a>	Manage destination filters
<a href="#">IAM</a>	Manage workspace users and roles
<a href="#">Functions</a>	Manage Functions

To see all the API methods and models see the [Segment Config API Reference](#).

At this time there are no language-specific clients. However the [API Reference](#) also contains example code snippets for cURL, Go, Node, Python and more.

## Quick Start

You can interact with the API from the command line. First install the `curl` tool.

```
$ brew install curl
```

## Access Tokens

You can use the Config API with an access token to programmatically access Segment resources that the token can access. Access tokens are created by workspace owners using the Access Management page, and can only access resources that the token has permission to.

These are currently only suitable for first party, trusted applications, such as your personal local scripts and server side programs. Partners should not prompt Segment users for their username and password and save an access token as a way to delegate access. See the [Authentication](#) doc for more information.

When you create an access token, you'll give it a description, a workspace, and determine whether it has workspace owner or member access.

### Secret Token

You can not retrieve the plain-text `token` later, so you should save it in a secret manager. If you lose the `token` you can generate a new one.

As of February 1, 2024, new Config API tokens cannot be created in the app as Segment moves toward exclusive support for the [Public API](#). [Migrate your implementation to the Public API](#) to access the latest features and available endpoints. To create a new Config API token, reach out to [friends@segment.com](mailto:friends@segment.com) for support.

## API Requests

Now that you have an access token, you can use this token to access the rest of the Config API by setting it in the Authorization header of your requests, for example:

```
$ ACCESS_TOKEN=qiTgISif4zprgBb_5j4hXfp3qhDbxrntWww0aHgAMr8.gg9ok4Bk7sw1P67rFyXeH3ABBsXyWqNuoXbXZPv1y2g

$ curl \
  -X GET \
  -H "Authorization: Bearer $ACCESS_TOKEN" \
  https://platform.segmentapis.com/v1beta/workspaces
```

Example response:

```
{
  "workspaces": [
    {
      "name": "workspaces/myworkspace",
      "display_name": "My Space",
      "id": "e5bdb0902b",
      "create_time": "2018-08-08T13:24:02.651Z"
    }
  ],
  "next_page_token": ""
}
```

## Reference

For an overview of the API's common design patterns and important information about versioning and compatibility, see the [API Design](#) document.

To see all the API methods and models see the [Segment Config API Reference](#).
