## Help

Now that we've confirmed that the user has been created, they already have access to the public schema that contains systems-level information about the cluster but we need to give them access to the specific schemas that they'll be working in.

## 2. Grant usage on the schema

Next, [GRANT USAGE](#) on the schema to the user we just created

```
GRANT USAGE ON SCHEMA <schema_name> TO <user>
```

The above SQL command grants the user USAGE privileges on a schema. Let's assume you want to grant flashthesloth access to your development schema, it would look like below

```
GRANT USAGE ON SCHEMA development TO flashthesloth
```

Our new user now has usage rights on the `development` schema, now we need to grant the type of SQL commands they'll be able to run against the cluster. For the purposes of this example, we're going to give the user read only privileges.

### 3. Grant select privileges

**GRANT SELECT** privileges so the user can query the tables

```
GRANT SELECT ON ALL TABLES IN SCHEMA <schema_name> TO <user>
```

The above SQL command grants the user SELECT rights on all tables in the chosen schema. For our flashtesloth user and the development schema, it would look like below.

```
GRANT SELECT ON ALL TABLES IN SCHEMA development TO flashtesloth
```

Doing these three steps will result in a new user that can query all the tables in a given schema. If you want to give access to more than one schema then you can simply repeat steps 2 and 3 for each additional schema. If you have any questions or if you're running into any issues getting this set up, [contact us](#).
